Subject: Comment to docket number EERE-2021-BT-STD-0035

Dear Sir or Madam

I became aware of the proposed rulemaking pertaining to energy conservation standards for air cleaners just recently, and as a representative of a company that develops and manufactures air quality sensors for use in air purifiers, it obviously struck my interest.

I completely see the value of regulating CADR/W in the maximum setting. At the same time, I believe that there is significant potential for energy saving by using air quality sensors (e.g. PM2.5 sensors, VOC sensors, etc.) for controlling the level of operation of the air cleaner, depending on the level of pollution in the indoor space where the device is used (i.e. auto mode).

Therefore, I propose to consider the adoption of air quality sensors for operation control in this rulemaking. To ensure appropriate quality of sensors being used, there are sensor performance requirements as defined in existing healthy building standards (such as WELL and RESET, see links below) that can be adopted for the rulemaking.

IWBI WELL: [WELL - International WELL Building Institute | IWBI \(wellcertified.com\)](#)

WELL performance verification guidebook: [WELL Performance Verification Guidebook | Tools | WELL International WELL Building Institute \(wellcertified.com\)](#)

RESET: [RESET® Standard](#)

RESET Air Standard: [Air Standard | RESET®](#)

I am not experienced with rulemaking and commenting, so please excuse if my comments and inputs are not very sophisticated. Nevertheless, I would be happy to hear back from you. Thank you for that.

Sincerely,

Vincent Hess
